# Objectives and Scope of Study

#### Business Objectives

- Analyse and study the data for small business merchants.
- Develop Univariate/Bivariate analysis for the transactions as per business requirement
- Clustering / Customer Segmentation Identify key Clusters based on Transaction type and description.

# Scope of Study

- Process and develop summary of the transactions
- **Identify patterns** between variables using distribution plots/charts.
- Time series analysis based on daily transactions.

# Data Period and data fields

- Data Period : Nov-2015 to Mar-2017
- A data sample of individual bank statement transactions from 20 small business merchants (indexed by Lead ID) from various industries.
- Each merchant could have multiple accounts (bank account id) over multiple months.
- Transactions may be **debits** (withdrawals) or credits (deposits) along with transaction description.

#### Approach/ Strategy?

Understand the requirement Gather data, Cleanse and analyse

Data analysis and Customer Segmentation

# Overview of the Analysis

#### **Process flow**

Understand the business requirements

<u>Data Cleansing</u> (Outlier/Missing Value Analysis)

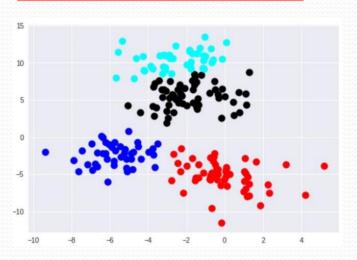

**Descriptive Analytics** on the data

A combination of NLP model with clustering

# Cluster Output of transactions

**Four Types of transaction descriptions** 

- Card Swipe transactions
- WorldPay
- Online Transfer
- Cheque/Check Payments

**Data File Format: MS Excel file** 

<u>Software platform used for analysis</u>: Google Colab (Python) & Google Drive, MS Excel & CSV Files, MS PowerPoint, Adobe PDF

# Data Import and Cleansing of data

The data information provided for bank transactions as per below snapshot:

1	Lead ID	bankid	bank_account _id	account_ number	Industry	post_date	description	transaction_ type	amount	running_ balance	trans_ order	month name
9981	318465	9262	13425	xxxx6643	Health Care and Social Assistan	22-Jul-16	POS Withdrawal - USPS xxxxxxxxx x583	debit	9.8	805.99	3	7
9982	318465	9262	13425	хххх6643	Health Care and Social Assistan	23-Jul-16	POS Withdrawal - FUEL COFFEE 1705 N	debit	10.7	733.46	3	7

- Data Imported in Google Colab which uses Python as the Language
- Benefits of using Google Colab
  - User can use Google Cloud Server's to code and process data
  - Use Google's Software and latest updated versions, no need to install latest version of python or packages separately, it installs and stores on cloud environment.
  - Utilize Graphical Processing unit (GPU) and Tensor processing unit (TPU) from cloud server.
  - The files imported seems to be have empty rows when checked for tail.
  - 'Nan' appears in last rows showing the rows with full missing data, initially processes 144836 rows.

#### bank\_2 = bank\_1.dropna(how='all')

Resulting values comes to have 29029 records.

```

```

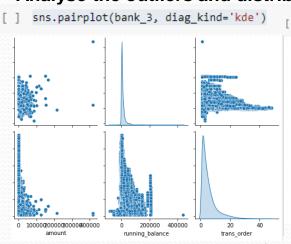

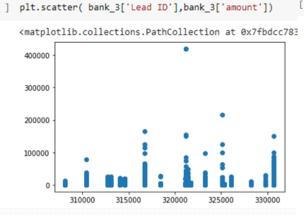

# Descriptive statistics (1/3)...

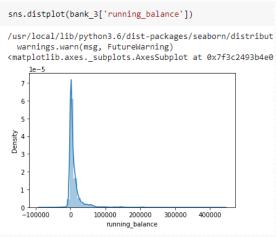

- Analyse and identify the patterns between variables.
- Partial Missing Values Reported: 'Month Name', Deleted column to create one from date.
- Summary of numerical values with vital stats like count, mean, min, max and percentiles.

 <pre>del bank_3['month name'] bank_3.describe()</pre>											
	Lead ID	bankid	bank_account_id	amount	running_balance	trans_order					
count	29029.000000	29029.000000	29029.000000	29029.000000	29029.000000	29029.000000					
mean	320714.718282	8823.888491	14052.030556	1927.453475	10247.851975	5.397223					
std	5051.317064	683.963276	703.164708	7450.638452	20055.683105	5.445505					
min	308148.000000	6192.000000	12460.000000	0.000000	-84727.980000	1.000000					
25%	316728.000000	8534.000000	13234.000000	29.250000	798.850000	2.000000					
50%	321380.000000	8535.000000	14049.000000	160.500000	3820.940000	4.000000					
75%	323253.000000	8545.000000	14636.000000	788.460000	11898.880000	7.000000					
max	330698.000000	10656.000000	15148.000000	419000.000000	437942.290000	48.000000					

Analyse the outliers and distribution between variables which might produce bias in the data.

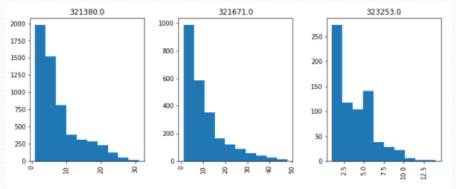

# Descriptive statistics (2/3)...

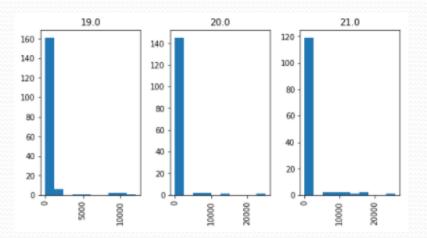

- Histogram to understand the transactional behaviour and derive insights:
  - Merchant ID Vs Trans\_order Out of 21 merchant IDs, 4 of them have maximum of >30 daily transactions on their accounts.

[ ] bank 3.hist(by='Lead ID',column='trans order',figsize=(20,30))

Trans\_order Vs Amount - Majority of transaction amount (>20K) is mainly till 21 transactions.

[ ] bank\_3.hist(by='trans\_order',column='amount',figsize=(20,40))

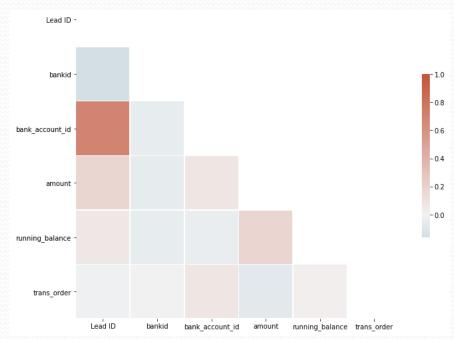

# Descriptive statistics (3/3)

- Considering the Correlation Analysis to study the relation between the variables.
- Post Analysing the results, there seems to be no high correlation between values (ignoring Lead ID Vs Bank account ID as these are ID variables).

```
# Compute the correlation matrix
corr = bank 3.corr()
print(corr)
                             bankid ... running balance trans order

#### Time Series: Merchant ID: 318465 & Bank Account: 13419 (1/2)

2. Consider Lead ID: 318465, bank\_account\_id: 13419 - plot the withdrawals, deposits and daily balance as a daily time series; do the same for Lead ID: 326062, bank\_account\_id: 14046

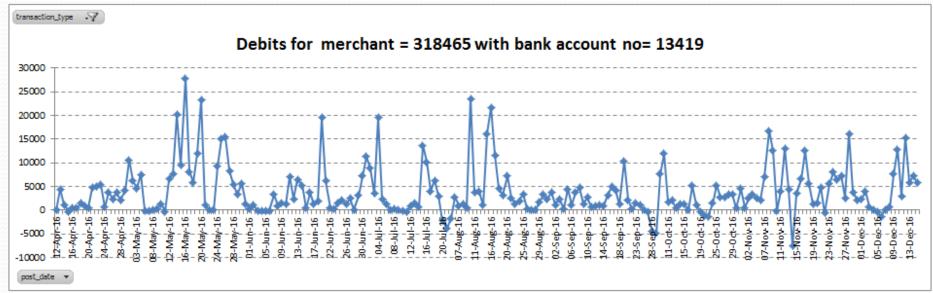

Data was filtered for the transactions to obtain the last transaction with running balance for each day as the final daily balance.

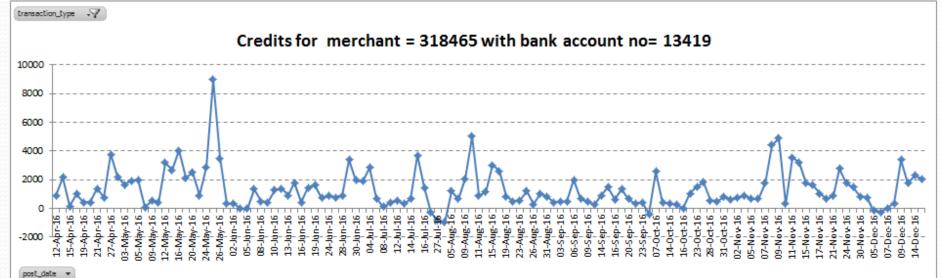

The Same has been done for Lead ID: 326062, bank\_account\_id: 14046 in the Python Code Submitted.

#### Time Series: Merchant ID: 318465 & Bank Account: 13419 (2/2)

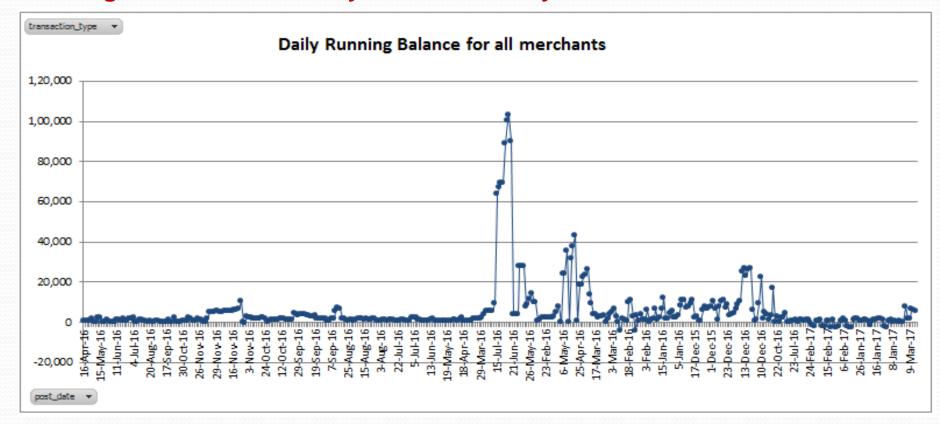

#### Overall Time Series for the data including all merchants (1/2)...

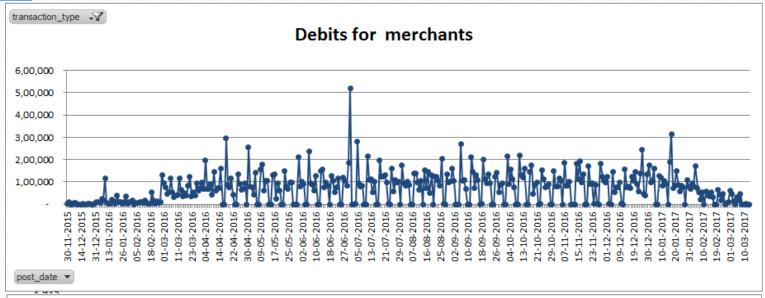

3. 3. For the merchants with the above Lead IDs, plot the withdrawals, deposits and daily balance as a daily time series (aggregate over all their bank accounts)

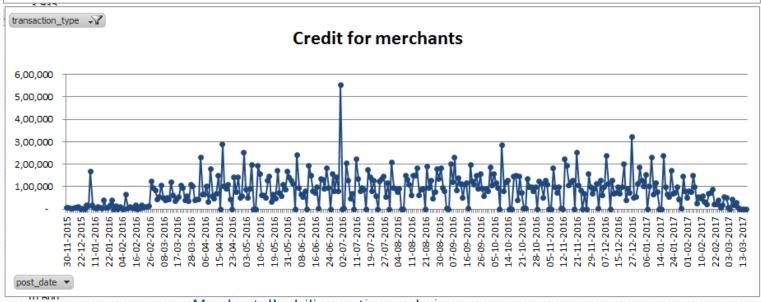

Data was filtered for the transactions to obtain the last transaction with running balance for each day as the final daily balance.

### Overall Time Series for the data including all merchants (2/2)

## **Cash Flow of the business: Additional Analysis**

Top 5 and Bottom 5 Analysis (by Merchant and Bank ID) and Distributions for amounts

```
#Top 5 Merchant IDs by amount
#del bank_3['month name']

#bank_3.to_csv('/content/drive/MyDrive/Bank_Data/Bank_Data_v3.csv', index=False)

bank_4 = bank_3.sort_values('amount',ascending = False).groupby('Lead ID').head(2)

print(bank_4.head(5))

#Bottom 5 Merchant IDs by amount

bank_4 = bank_3.sort_values('amount',ascending = True).groupby('Lead ID').head(2)

nity

Data Errors

Industry Analysis

 No. of transactions for merchants help analyse their volume of trade, Opportunity for New Business Check for data discrepancy in running balance vs Amounts

 Distribution of amounts and Industry level analysis which could help understand the GAP between different merchants.

# Application of NLP: A Cluster Model to segment the banking transaction descriptions (1/3)...

#### Cluster Model done using below process:

1. Include a new field primary key for reference. 2. It is combination of Lead ID, Bank ID, Bank Account ID and transaction order  1. Keep only the fields required in the data. We keep Primary Key, Transaction type and transaction description.  1. Initially running a k-means clustering on the Numerical fields in data to understand the cluster behaviour.  2. For Clustering.  2. For Clusters, install the required packages NLTK, k-means and sklearn, tfidfvectorizer, train test split  3. Apply K-means clustering on string for 10 clusters and transaction of transaction description and transaction type for Clustering.	D	eclare Primary Key	Pre-Processing Data	k-means clustering with ELBOW Method	k-means clustering with ELBOW Method
optimal solution		field primary key for reference.  2. It is combination of Lead ID, Bank ID, Bank Account ID and transaction	a k-means clustering on the Numerical fields in data to understand the cluster behaviour.  2. Keep only the fields required in the data. We keep Primary Key, Transaction type and transaction	combination of transaction description and transaction type for Clustering.  2. For Clusters, install the required packages NLTK, kmeans and sklearn, tfidfvectorizer,	combination of transaction description and transaction type for Clustering.  2. Split the train test sample and use the whole data for modelling clusters.  3. Apply K-means clustering on string for 10 clusters  4. Use ELBOW Method to decide on the inflexion

# Application of NLP: A Cluster Model to segment the banking transaction descriptions (2/3)...

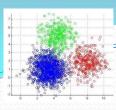

- Fitting for 15 clusters to test for minimum no. of clusters.
- From the below chart, 3 or 4 looks a valid no of clusters to test the model.
- We fit the model for both the clusters and view the 3/4 clusters by transaction descriptions.

```
# Using the elbow method to find the optimal number of clusters
